

HYBRID

UNPRECEDENTED
PERFORMANCE

DIAMUT

HYBRID

HYBRID is the new high-speed peripheral grinding wheel developed by Diamut. A new segmented wheel, on which the spaces between each segment have been filled with a special resin. This characteristic enables the grinding wheel to remain in continuous contact with the glass to be ground, reducing the size of the glass splinters created, thus resulting in an increase in feed rate.

The segmented grinding wheel with FILLER is ideal for use in the first roughing position, in sequence with standard finishing wheels such as EVOX.

Also available in a version for use in the first position on a flat edge double edger, as an oscillating grinding wheel.

- ▶ The HYBRID grinding wheel is available for vertical or horizontal CNC operations with a diameter of 100, 150 or 200, and for double edgers with a diameter of 200. Furthermore, HYBRID is available in a pre-shaped version (with trapezoidal or pencil edge profile) for a further increase in performance.
